

PEDESTAL READY PORCELAIN PAVERS

2cm porcelain manufacturers require added safety measures when placing their pavers on pedestals. Though it is extremely rare, any paver can break, but our proprietary factory installed high-tech composite backing prevents a broken paver from shattering, splintering or dislodging, thus reducing the risk of injury.

With **UnderLockSB** (safety backing), the paver may crack after an exceptionally high point load, but all of the broken pieces are held together. It is still possible to walk on the paver until it can be replaced.

UnderLock SB Benefits:

1. Factory installed on ANY size paver.
2. No added trays, sub-grid or adhesives required.
3. Best value. Safety backed pavers arrive at your site ready to put in place.
4. If wind uplift or vandalism is a concern, you can upgrade to **UnderLock FS** (full system) a fully integrated, patented porcelain paver lock down system.
